

A hand is shown pouring a thick stream of white granulated sugar from the opening of a red and silver soda can. The sugar falls into a large pile at the bottom of the frame.

When sugar is **NOT** so sweet

A brief guide to explain how sugary drinks can harm your health

Letter to Providers

Directors of the Alaska Department of Health and Social Services oral health and obesity prevention programs talked with Alaska dentists, hygienists and parents to develop “When Sugar Is Not So Sweet.” This brief guide includes simple visuals and messages dental providers can use to talk with patients about cutting back on sugary drink intake to reduce chronic disease risks and dental decay. The guide also helps patients come up with a plan to cut back on sugary drinks. Drinking sugary beverages puts Alaskans at risk for obesity^{1,2,3}, type 2 diabetes⁴, heart disease and tooth decay.^{5,6}

Sugary drinks are the leading source of added sugar in Americans’ daily diets. Added sugars contribute about 13% of total daily calories. About 47% of calories from added sugars come from sugary drinks.⁷

In Alaska, high consumption of sugary drinks starts at a young age. One out of five Alaska parents of elementary-age children serves their children a sugary drink every day, and two out of three parents serve their kids sugary drinks one or more times each week.⁸ Many Alaska adolescents and adults also drink sugary beverages every day:

- 42% of Alaska high school students⁹ and 23% of adults¹⁰ consume one or more sugary drinks daily.
- Alaska Native high school students (58%) are significantly more likely than white students (34%) to consume at least one sugary drink a day.⁹

Discussions with Alaska parents revealed confusion about sugary drinks. Some parents did not know about the high sugar content of vitamin drinks, sports and fruit-flavored drinks, and powdered beverages. Discussions with dental providers revealed that many providers felt confident about linking sugary drinks to an increased risk of dental decay, but they would benefit from a guide to facilitate those conversations and wanted more help discussing how sugary drinks are associated with increased risk of chronic conditions. This guide

integrates motivational interviewing techniques and adapts the effective tobacco cessation intervention known as the “5A’s”¹¹ to address sugary drinks.

The Centers for Disease Control and Prevention Division of Oral Health supported this effort because dental providers are uniquely positioned to promote health behaviors to prevent chronic disease.¹² Most Alaskans see a dentist every year.^{13,14} Dental health and obesity prevention professionals working together can help reduce sugary drink consumption and prevent serious health outcomes for Alaska families.

When Sugar Is Not So Sweet: A brief guide to explain how sugary drinks can harm your health

October 2017

Bill Walker, Governor
State of Alaska

Valerie Davidson, Commissioner
Department of Health and Social Services

Division of Public Health
Section of Chronic Disease Prevention and Health Promotion
Obesity Prevention and Control Program
Women’s, Children’s and Family Health
Oral Health Program

For more information, please contact the department at (907) 269-2020 or obesity@alaska.gov. This document is available at www.playeveryday.alaska.gov and <http://dhss.alaska.gov/dph/Chronic/Pages/Obesity/default.aspx>.

How to use this guide

This guide will help dental providers talk through the 5A's of a brief office intervention to help patients reduce their sugary drink consumption:

- **Ask** about sugary drinks
- **Advise** to reduce consumption of sugary drinks
- **Assess** readiness for making a change
- **Assist** with developing a plan of action
- **Arrange** for follow-up and support

The philosophy: This guide uses the Motivational Interviewing (MI) method, a technique that shows promising results in helping people make positive behavior changes for obesity prevention. This conversation technique is recommended by the American Academy of Pediatrics.¹⁵

Motivational Interviewing allows patients to voice their concerns and ideas for behavior change, rather than having the provider tell patients what changes to make, and why. The basic conversation techniques follow: open questions, affirmation, reflective listening and summary reflections. The goal is helping patients determine a behavior change to promote healthy lifestyles. The youth or parent determines what they want to focus on and the healthcare provider uses reflective listening to guide them toward change.

This guide has two types of pages:

1. The patient view has mainly pictures, graphs and few words.
2. The provider view shows a thumbnail picture of the patient view and gives instructions, messages, tips and example responses that you can use during your discussion with patients.

On the provider view pages, you'll find common design elements to help you talk with your patients.

Patient view: A small thumbnail of the patient view allows you to remember what the patient is looking at as you guide the discussion.

These shaded green boxes provide the purpose of the patient view and some general instruction. They are not to be read aloud.

These are key messages to be shared out loud with your patients. They aren't meant to be read word-for-word, but certain phrases are in **bold, larger font** to help you quickly scan the page for the most important, key messages. The guide lists "Other ways to say this or ask this" to give alternatives if the sample text doesn't meet your conversation style.

The example responses in the blue boxes share a potential discussion with a patient. You will vary your response based on your professional clinical judgment. Some example responses include bolded statements, such as **"Did I get that right?"** These bolded statements are recommended for you to say out loud as you respond to your patient.

These tips provide background information, frequently asked questions, or other helpful explanations.

DISCUSS

Use this visual of various beverages to start a discussion about what your patient drinks.

"Let's look at these images together. Tell me which of these drinks you have on a typical day?"

Other ways you could ask:

"So, when you're thirsty, what do you like to drink?"

"How many of these drinks do you have each day?"

"Which of these are your favorite drinks?"

"Which of these drinks do you give your child when they're thirsty?"

"What does your family drink during meals/snacks/as a treat?"

Ask the child first, then confirm with the caregiver. Ask more about amounts or timing. If needed, use brand names to clarify images.

REFLECT

Reflect back the patient's response to confirm understanding. Ask about the pros and cons of the drinks they picked.

"So, your family drinks mostly water, fruit-flavored drinks, and milk every day. **What do think are good things and bad things about these drinks?**"

Asking the patient to start the conversation about the good things and bad things about sugary drinks helps them be in charge, rather than just passively receiving advice.

SUMMARIZE

Summarize the good and bad responses they give you. Start with the good and end with the bad. Do not add your own bad examples.

"Your kids really see juice pouches as a treat, and they're easy to pack in a lunch box. These pouches can be expensive, though, and you're concerned they have too much sugar for your children's teeth. **Did I get that right?**"

Sugar Hurts Your Teeth

Take this opportunity to advise your patient to cut back on sugary drinks. Use this image to help describe the process of tooth decay when teeth are exposed to sugar.

"I'm concerned about how sugary drinks are affecting your child's teeth and overall health."

"I know you want your child's teeth to be healthy, and one way to do that is to cut back on sugary drinks. Is it OK if I spend just a minute showing you a bit more information?"

"This image is showing us a simple way to understand how sugar and sugary drinks hurt your teeth.

When you drink or eat sugar, the bacteria that are naturally in your mouth start eating that sugar.

That creates acid in your mouth. That acid starts attacking the teeth and dissolves the enamel of your teeth.

The enamel is really important because it covers your teeth to protect them.

When you lose enamel, your teeth start decaying and painful cavities can form.

Cutting back on sugary drinks can make you much healthier and prevent you from feeling the pain of cavities."

PATIENT VIEW

Sugar Hurts Your Teeth

If the patient reports drinking few sugary drinks, compliment them, but also take a minute to encourage them to continue limiting sugary drinks.

"I realize your family rarely has sugary drinks. That is great, and I encourage you to continue limiting them. **Is it OK if I spend just a minute showing you a bit more information to help you protect your child's teeth and overall health?"**

Tooth Decay from Sugary Drinks

Photographs from Southcentral Foundation

Use this image to improve your patient's knowledge and understanding of how sugary drinks can hurt their teeth, and the importance of caring for baby teeth.

"Over time, sugary drinks can lead to tooth decay.

The first stage of decay may be difficult to notice on teeth.

As enamel starts to dissolve, you may notice some changes to the teeth.

More advanced dental decay can appear brown or black.¹⁶ At times, untreated advanced decay cannot be fixed, and the tooth may need to be removed."

Share more information to help the patient understand the importance of healthy baby teeth.

Taking care of teeth — even baby teeth — is important. Baby teeth hold the space in the mouth needed for permanent teeth that come in later. Cavities that develop in teeth can be painful. Cavities can cause problems with:

- eating.
- sleeping.
- speaking.
- learning.

Fixing baby teeth by filling them, pulling them out, or putting crowns on them can:

- be expensive.
- cause pain.
- change the appearance of a child's smile as they grow up.

Health risks from sugary drinks

Use this image to improve your patient's knowledge and understanding of how sugary drinks can hurt their health.

"Sugary drinks and added sugar harm more than just teeth. These drinks can lead to a number of serious health problems that can last throughout your child's lifetime."

Unhealthy weight gain^{1,2,3}

- "Being overweight or obese is a serious health concern."
- "That's in part because excess weight is linked to other serious health problems, like type 2 diabetes."

Type 2 diabetes⁴

- "Type 2 diabetes used to be considered a health problem that only adults could get. That's not the case anymore."
- "Type 2 diabetes happens when too much sugar builds up in your blood, and that puts stress on your body."
- "For some children, type 2 diabetes can be a health struggle for the rest of their lives and require medication and other changes to diet and physical activity."

Heart disease^{5,6}

- "Some people are surprised to learn that sugary drinks can lead to heart disease over time."
- "Sugary drinks can increase your child's risk of high blood pressure and high cholesterol."
- "If those health problems aren't treated and managed, they can lead to serious heart problems as your children get older."

PATIENT VIEW

The statements below can help you respond to additional questions from patients. You DO NOT have to read each one out loud.

Obesity during childhood can harm the body in a variety of ways.

Children who have obesity are more likely to have:¹⁷⁻²⁷

- high blood pressure and high cholesterol, which are risk factors for heart disease.
- increased risk of type 2 diabetes.
- sleep problems, such as sleep apnea.
- breathing problems, such as asthma.
- gastrointestinal problems, such as reflux disease or constipation.
- hip and knee joint problems and pain.
- fatty liver disease or gallstones.
- a skin condition called acanthosis nigricans.
- psychosocial disorders, such as anxiety, fatigue, depression, low self-esteem, eating disorders, as well as social problems, such as bullying and stigma.

Are you ready?

NOT

SOMEWHAT

VERY

Are you ready?

1 2 3 4 5 6 7 8 9 10

NOT SOMEWHAT VERY

Use this readiness ruler to assess your patient's interest in making a change. Match the appropriate brief intervention with their score for readiness for change.

"Look at this scale of 1 to 10, where 1 is not ready and 10 is very ready. How ready are you to make a change about serving fewer sugary drinks to your family?"

Use your clinical judgment on which actions to take. If a patient is already making plans to reduce sugary drinks, you may decide to skip one or more of the pages that "Assist" with making a plan and move to page 18, "Arrange" for follow up.

SCORE 1-3: NOT READY FOR CHANGE

"I understand you aren't ready to make a change right now and that's OK. Is it OK if I make a note of our discussion today and we talk about it a bit more at your next appointment?"

End your conversation about sugary drinks and make a note in the patient record.

SCORE 4-10: SOMEWHAT OR VERY READY FOR CHANGE

For scores 4-7 (contemplation) and 8-10 (preparation/action), ask what makes them ready to change.

You gave yourself a score of [#] for being ready to change the types of drinks you serve your family. Why did you pick this score and not a 2?"

Letting the patient describe why they scored themselves a 4-10 instead of a 1-3 affirms their ability or desire to change and is more effective than trying to convince them to move into a higher score. Use their words to talk about their motivation to change.

"That is great you would like to make a change. I have a few tools that will help you decide which changes will work best for you and your family."

Which drinks are hiding the most **added sugar**?

Water and low-fat milk have **NO** added sugar.

Use this image to improve your patient's knowledge and understanding of how much added sugar is hiding in common drinks so they can make a plan to choose healthier drinks.

"You can see how much sugar is hiding in each drink. What do you notice when you look at these drinks? Is there anything that surprises you?"

Summarize the patient's responses and affirm what the patient says.

"Yes, it is surprising that vitamin and sports drinks have so much sugar, even though they are marketed to families as healthier options."

"As you said, water and milk don't have any added sugar so they are the healthiest choices."

"Does any of this information bring up changes you'd like to make for your family?"

"That's great you want to serve fewer powdered drinks. Many of my patients are surprised by how much added sugar is in powdered drinks."

Just ONE sugary drink often has more sugar than your child should have in one day.

Use this image to improve your patient's knowledge and understanding of the U.S. Dietary Guidelines, so they can make a plan to choose healthier drinks.

"Now that we know how much sugar is hiding in these drinks, let's review the health advice."

The U.S. Dietary Guidelines for Americans say to limit added sugar to less than 10 percent of the calories you eat and drink every day for good health.¹⁸

- For a moderately active child, that's only about 10 teaspoons.
- For a typical 2,000 calorie diet for an adult, that is no more than 12 ½ teaspoons."

Other ways to say this:

"It might sound complicated to figure out your limit of added sugar each day. Here's a simpler way to think about it. Added sugar — whether it's in your foods or your drinks — should be a really small amount of what you consume each day. Cutting out these sugary drinks avoids a lot of sugar and protects your child's teeth."

"As you can see from this image, even a 16-ounce powdered drink has more added sugar than a child should have all day. A child can go over the daily limit of added sugar with just that one drink at breakfast — without considering added sugar from sweetened cereals, snacks, or other drinks during the day."

"What do you think about this health advice? Does any of this information help you think of changes you'd like to make for your family?"

PATIENT VIEW

Summarize the patient's responses, affirming what the patient says.

Reinforce your patient's discussion of desires, abilities or reasons to change behavior. Reinforcing statements by repeating them or summarizing them to patients can help empower them and support their success in making a change.

"You're right. Most of the drinks we just looked at have too much added sugar for good health."

"You're right. These drinks do have too much added sugar for good health. Cutting back on these drinks can make a big difference."

Pick a plan

Limit sugary drinks to only special occasions, like birthday parties or holidays.

Serve smaller servings of sugary drinks.

Be a role model at home. Reduce the number of sugary drinks YOU consume each week.

Send children to school, day care or camp with a refillable bottle of water.

Drink water when you get out and play.

Keep water chilled in bottles or pitchers in the refrigerator.

Drink water when you are thirsty.

Don't sip sugary drinks during the day. Limit to meal times.

Do not keep sugary drinks in your home.

Make water fun. Add slices of fruit or sprigs of mint, or give your child a fun straw to use.

Use this image to assist your patient in choosing a step in their plan to choose healthier drinks.

"Sometimes it helps to make a plan if you think through some options. Do you see anything on this page that would be a way your family could make a change? Do you want to pick a change or two that you think will work for your family?"

Other ways to ask:

"How well do you think this option would work for you and your family to start cutting back on sugary drinks? Why or why not?"

"What else might work best for your family?"

"Who can support you in making this change?"

These steps are not the only options. If a patient already described a step earlier in the conversation, you can move directly to the next page.

If a patient has gone through this tool before, refer to your patient notes and try some of these example responses.

"Last time, you chose this step to cut back on sugary drinks.
How has that been working for your family?

Would you like to keep taking that step?"

"What about these other options? Could you add any of them to cut back even more on serving sugary drinks to your family?"
